## How to Find Applications Installable With Package Manager

Hi Community!

[@Joan Pérez](#) published a review that it is not very clear what applications are available for InterSystems Package Manager. Thanks Joan! Indeed it deserves a post.

There are at least two ways I know to showcase them:

1. Run find command in zpm:

```
IRISAPP>zpm
```

```
=====
|| Welcome to the Package Manager Shell (ZPM).                               ||
|| Enter q/quit to exit the shell. Enter ?/help to view available commands ||
=====
zpm:IRISAPP>find
registry https://pm.community.intersystems.com:
analytics-okr                1.0.0
analyzethis                  1.2.4
aoc-2021-uvlg                0.0.2
aoc2021-rcc                   0.0.2
appmsw-dbdeploy              1.0.3
appmsw-docbook                1.0.5
appmsw-forbid-old-passwd     1.0.4

....
```

Or find -d to list them with descriptions:

```
zpm:IRISAPP>find -d
registry https://pm.community.intersystems.com:
analytics-okr                1.0.0
analyzethis                  1.2.4 Description: Module that helps to
                                generate cubes, pivots and
                                dashboards vs IRIS data
aoc-2021-uvlg                0.0.2 Description: Advent of code 2021 in
                                COS classes
aoc2021-rcc                   0.0.2 Description: AoC-2021 full Embedded
                                Python demo
appmsw-dbdeploy              1.0.3 Description: An example of deploying
                                solutions with prepared databases,
                                even without source code.
appmsw-docbook                1.0.5 Description: Importing docbook

...
```

2. The second way is to [filter OEX on ZPM](#):

## 239 Application(s)

Sorted by: Recently updated ▾

✖ Reset all filters

Show only

☐ Bookmarked by me

☐ Subscribed by me

☐ Products with demo

☒ Applications with ZPM

Share your ways to list public packages?

This was related to public repos, of course there are a lot of private repositories and we don't know what is there.  
How do you expose packages?
