Patient Labels Design Dilemma: ZPL Abstract Class vs JReport(LOGI)

I am reaching out to find out if anyone has come across a similar dilemma.

In my current role, I have been asked around the best way to design some patient labels for a client.

I primarily would stick to what I know and veered towards designing the label in ZPL and then creating a Abstract Class to call the ZPL code, however I have been asked why not to design via JReport. The patient labels will be processed via thermal ink printers primarily Zebras, I am wondering if anyone out there has come across this or would recommend to stick to what you know.

I have reached out via I-Service but great to hear what other developers would recommend?
