Process XML document

Hi all,

I am looking at a task which involves processing an XML file. Picking the file up from a folder (c:\test.xml) reading the data out of the XML and archiving the xml after it has been processed.

I was wondering what the best way of doing this would be?

I have got as far as creating a service in Ensemble. The Service I have created uses the class name EnsLib.XML.Object.Service.FileService.

Any advice or tutorials/guides would be much appreciated.

Many Thanks
