Installing Apps without Docker

I was wondering if someone could help me. I do not have docker available to me however a lot of the Open Exchange apps require it. Since I am using a Virtual Windows Machine I can not get docker installed, so I was wondering how to get around this? Someone at GS 2022 suggested looking at the docker_compose.yml to figure out how to get around docker, but I am not sure I understand how to read it.

Does someone have any quick solutions to get around docker compose? Or can tell me how to read a docker compose so that I can install some Open Exchange and or additional InterSystems components?

Thanks

Scott
