Email Template

Does anyone have any pointers or maybe familiarity of making Email templates in Objectscript?

I'm currently trying to implement Televisits with our system and am needing to send an email to the patient. I'd like to make it a nicer looking email which will require a good amount of inline CSS. I currently have a method, but is very much a sore sight for the eyes.

I was wondering if there was a way I could use Embedded HTML and pass that into the DO msg.TextData.Write command with the `##class(%Net.MailMessage)?`
