Question on Subtransform in DTL to transform from a JSON/XML to a custom message

I am building a DTL to transform from a JSON/XML to a custom message. The DTL works fine, but I wants to move some part of the data transformation to another DTL and calls it using the `<subtransform>` action from the main DTL.

to define

```
I have the <subtransform class='ADT.DTL.SDToPatientIdentifierInfo' targetObj=
'target.PatientIdentifierInfo.()' sourceObj='source.{Patient.Extension.PatientIdentifiers(k1)}' />
```

when I am testing this subtransform I am getting the following for each identifier in the message.

[illegible]

My expectation is receiving the PatientIdentifierInfo in array of JSON format.

Does any one knows why?
