Zen - Manipulate a result set for Zen report?

Have a Zen report with a huge query that we are trying to break down and be more efficient.

Looks like Zen only wants to take a result set class as the data (or XML, but writing to a file to generate these reports is probably even more overhead).

Is there a way I can move through a result set object, delete rows I don't want based on some objectsript commands and the pass that to the report?

Or can I pass a dynamic object?

Thanks.
