Can run application in IE

Hi Guys,

My application is running in Chrome but not in IE and I'm guessing it's a security issue, where when I open IE it tells me that ESC in on, but checking the configure in Server Manager tells otherwise?

The image shows two screenshots. The top one is a browser window displaying a security warning: "Internet Explorer Enhanced Security Configuration is enabled". The text below the warning explains that IE ESC is currently enabled on the server and lists security settings. The bottom screenshot shows the Windows Server Manager interface for a local server. The "PROPERTIES" section shows system information like computer name, workgroup, and updates. A dialog box titled "Internet Explorer Enhanced Security Configuration" is overlaid on the screen, showing options for Administrators and Users to turn the configuration On (Recommended) or Off. The "Users" option is currently set to Off.

Thanks
