## Implementing simple web interface, how?

Hi,

Over time I have created an house-automation solution based on IRIS:  
90% of my code is pure ObjectScript, with the most recent 10% being the use of Python libraries for specific tasks.  
All of the above being terminal based up to now.

I would like to expose some configuration options / parameters via a very simple web page, to be serviced with the IRIS private web service (so I don't want to use an external Webserver just for this..)

My question:

how should I approach the creation of this simple, one page, web page?

Should I write it manually, in the "old" CSP way, copying some examples from SAMPLES, or is there an easy and fast way to generate such a basic input page using some existing libraries and/or tools?

I am Mac based, using VS Code.

This is purely for my own internal need and use, so security/scalability etc play no role.

Thanks
