Is there a simpler way to get posix time with fractional seconds?

Currently what I have is:

```
set now = $now()
set ts = $zdt(now,-2) _ "." _ $p(now, ".", 2)
```

[Docs state](#) (for -2 dformat):

> Fractional seconds in the input value are permitted, but ignored.

I wonder if there's some other way to get posix time with fractional seconds?
