Access global variable on remote system

Hello All,

I have a class method on the DocRepo server that needs to query the data value of a global variable on the Edge server.

I have looked at the documentation for 'Global Structure,' but I didn't find anything that helped.

[Global Structure | Using Globals | InterSystems IRIS Data Platform 2022.1](#)

I am able to access this global easily from the Edge server using the \$Get function, but I need to access it from the DocRepo server.

Any suggestions would be greatly appreciated!

Thanks!

Craig
