Launching an application from a CSP Page

Hi -

I'm looking for some help in getting an OS level application on my server to startup from a csp page and I'm just missing something.

I have a routine (and I've tried the same code from an instance method, with the same results) that will launch an application at the OS level using the $zf(-100,keywords,program,parms) from a terminal session, but it won't/doesn't seem to work when I call the code from a #server() call from my webpage. I don't know if there is some combination of keywords or perhaps a different version of the $zf() call that should/would work.

I am open to any suggestions at this point.
