Share ZPM technique?

Anybody willing to share a method form the ZPM cli (or othewise) where zpm will "Install package if not already installed?" I would want this to count for updates too I think as I would want to control that too.

The use case is in a CI-CD pipeline, where the pipeline can be used to provision start to state, but for some things only do once. An example would be I have a package that provisions a fhir package or search parameter in my own way, but doesnt do it again when somebody merges operational code and the pipeline fires again, it would not attempt to load the fhir package again.
