What is the Analog of $DATA for Embedded Python?

Hi folks!

I'm working with a global via Embedded Python as a class method. I init the handler for a global via:

```
gl=iris.gref("^Global")
```

What is the way to check the value at index ^Global("x","y")? E.g.:

In ObjectScript I'd do the following:

```
set result=$data(^Global("x","y"))
```

How do I do the same in Embedded Python?

I checked the [documentation,](#) but haven't found an answer.
