## Promoting DR async to primary, does the ZMIRROR routine run?

Basically the title, I couldn't find anything concrete in the documentation regarding this. The documentation states 'The user-defined ^ZMIRROR routine allows you to implement your own custom, configuration-specific logic and mechanisms for specific mirroring events, such as a failover member becoming primary.' I didn't see any more details on what exactly those mirroring events are besides a failover member becoming primary, which I wasn't sure if that included a DR async becoming primary.

[#Mirroring](#) [#InterSystems IRIS](#)

Product version: IRIS 2022.1
