## Announcing SAM (System Alerting & Monitoring) 2.0

InterSystems is pleased to announce the release of System Alerting & Monitoring (SAM) version 2.0.

### What is SAM?

SAM marries IRIS 's standards-based [Monitoring API](#) and [Log Monitor](#) with familiar industry standard tools like Grafana and Prometheus to create a basic monitoring and alerting solution for IRIS clusters.

For more on SAM, see the [System Alerting and Monitoring Guide](#).

### What ' s new in SAM 2.0?

The industry standard tools that SAM relies on have all been upgraded.

Configuration Export & Import – You can now export your SAM configuration and re-import it into another SAM instance. This makes moving from one environment to another easier.

Multiple Grafana Dashboards – You can now create multiple dashboards in Grafana and choose the one you want shown by default for each IRIS instance.

HTTPS & URL Prefixes – SAM can now use HTTPS to gather observability data from your IRIS instances. Additionally, you have the option of specifying a “ URL path prefix ” that enables SAM to monitor multiple IRIS instances running on the same host.

See the [documentation](#) for more information on SAM 2.0.
