Community Edition of Iris identified as malicious by McAfee and Malwarebytes

Yesterday I downloaded and attempted to install the newest version of the Community Edition of IRIS but not the preview, and attempted to update an older version, but each time I tried to install it, I would get an error, and then an antivirus program would indicate that it had identified and blocked a threat (McAfee identified it as GenericRXAA-FA!EAEEF9B8457F with a location of C:\Users\jivey\AppData\Local\Temp\pbt3FDD840C\IRISx64.msi). I tried the installation again this morning and this time a threat was identified by Malwarebytes as Malware.AI.4072586503 and McAfee identified it as it did yesterday. I was trying to upgrade my system for Open Source development, but now have removed the previous IRIS installation and don't have IRIS on my development system.

I have no idea what is going on with this installation, I have never had a problem before, and in the Product Version that I could select from while entering this message 2022.2 doesn't exist.

[#InterSystems IRIS](#)
Product version: IRIS 2022.1
$ZV: IRIS 2022.2.0.36.0-winx64.exe
