Visual Studio Code Debugging

I am currently trying to better my development process by using Visual Studio Code because I'm more familiar and comfortable with it than Studio.

I've followed the guide [here](#), but I'm still having issues. I initially didn't have the Web Socket protocol allowed on my Web Gateway server, but I enabled that and restarted the server with no luck.

Am I just on too old of a version? Is there any way I'd be able to use Visual Studio Code and be able to debug with what I currently have? I wish I could upgrade to IRIS, but that doesn't seem to be an option.

I am able to query processes on my server to attach to them, but after I select a processId it just loops endlessly not doing anything. I've tried debugging through a launch instead of an attach and it is the same behavior.

Any help in this matter would be greatly appreciated!
