Is there an installer for the jdbc drivers on Windows

Hi ,

I am trying to work out how to install the intersystems-jdbc-3.3.1.jar file onto a windows server to set up a connection between athrid party application and an Iris database.

Is there an installer ? the java -jar etc command does not work "could not load main class " . Added the folder to the system path .

Running Eclipse temurin but I do not work with java at all, other than these very specific points where need to get applications to run .

If someone could point me to a guide or instruction that would be of great assistance

Cheers

Michael
