How to use Data Transformation in Interoperability Production?

Hi Interoperability experts!

I'm into interoperability now with data transformations and I wonder: how can I use DTLs?

I've created one that transform Ens.Request into Ens.Response. How can I use it now in the production?

I'm trying to add the business process expecting to see it available in the list but it seems it is not the case.

Tried documentation and it doesn't say either what to do after creation the DTL. If it is obvious could you please help?

BUSINESS PROCESS WIZARD

Add a new Business Process to this Production.

All Processes	HL7 Router	X12 Router	Component
