Can python fhirpy fhir be used to get a list of patients from my end point that has a particular diagnosis and or insurance?

Newbie here...

I am looking to use fhir to gather patients in our end point that have a certain diagnosis and or certain insurance.

Is this what fhir can be used for?

In the past I have done the normal SQL query/extract to CSV file. Looking to use fhir for this for future.

Thanks in advance for your time

Dean-O
